## Sentry-SEAL

**Secure and Protect Any Asset**  
Alarms for: Fiber interruption, seal moved, seal opened, communication lost, and low battery (wireless).

The Sentry-Seal secures and protects access to any drawer, panel, cabinet, or door. The Sentry-Seal interfaces with the Sentry-RMS to provide real-time monitoring, alarm notification to security personnel, and breach notification via SMS and/or email to select individuals.

The principle of the Sentry-Seal is simple: a fiber-optic line is wrapped around the panel or door to be protected, if the fiber-optic line is broken, it activates an alarm. The Sentry-Seal incorporates proprietary encryption algorithms and tamper protection so that the device's transmissions cannot be spoofed, tricked, or disabled.

There are two versions of the Sentry-Seal – a wired version and a wireless version. The wired version connects and communicates directly to a Sentry-RMS or an alarm panel/system. The tethered connection provides communication as well as a constant source of power. This connection eliminates the need for battery replacement, allowing for zero-maintenance operation. The wireless version connects 1-8 wireless seals to a single receiver connected to a Sentry-RMS or an alarm panel.

## Sentry-SEAL wireless

The Sentry-Seal Wireless communicates over a Bluetooth connection with a receiver connected to the Sentry-RMS. The receiver can communicate with up to eight different transmitters in order to seal eight separate locations. Each of these devices may then be individually integrated with the Sentry-RMS desktop software.
